L5 ANSWER 12 OF 12 CAPLUS COPYRIGHT 2007 ACS on STN
AB . . . transfected with high-titer (1.5×10^5 CFU/mL) retrovirus supernatant, and by selection with G418 pos. cell clones (T/pCD2) were obtained. PCR and RT-PCR showed that the cytosine deaminase (CD) gene was transferred into the T-lymphocyte and expressed successfully. T-lymphocyte and T/pCD2 cells were exposed to different doses of 5-fluorocytosine (5-FCyt) for various hours, and were then observed under light microscope and the viability of these cells was determined by MTT colorimetric cell proliferation assay. Retrovirus-mediated CD gene transferred to T/pCD2 cells could confer them high sensitivity to 5-FCyt, and T/pCD2 cells exposed to 5-FCyt ($> 1 \mu\text{mol/L}$) can be killed. But 5-FCyt was not harmful to normal T-lymphocyte cells. The survival time of T/pCD2 cells in the presence of 5-FCyt (3.apprx.5 d) was shorter than that of T-lymphocytes (>14 d).
